Kerb® SC

EPA Reg. No. 62719-578

Special 2(ee) Recommendation†

For Distribution and Use Only in the States of Idaho, Nevada, Oregon, Utah and Washington

Grass Weed Suppression in Alfalfa

ATTENTION

†This recommendation is made as permitted under FIFRA Section 2(ee) and has not been submitted to or approved by EPA.

- It is a violation of Federal law to use this product in a manner inconsistent with its labeling.
- Read the label affixed to the container for Kerb SC herbicide before applying. Carefully follow all precautionary statements and applicable use directions.
- **Except as specified in this product bulletin, use of these products is subject to all use precautions and limitations imposed by the label affixed to the container.**

Directions for Use

Apply Kerb® SC at a rate of 0.625 to 1.25 pints (0.25 to 0.5 pounds active ingredient) per broadcast acre for the suppression of susceptible winter annual and perennial grasses. The level of weed suppression will depend on the weed species and the type of irrigation used or the dependability of rainfall following application. Typically, greater weed suppression is observed in areas with dependable rainfall or where overhead irrigation is used.

Tank mixtures of Kerb SC with other preemergence or postemergence herbicides registered for this use may provide a broader spectrum of weed control. Read and follow container labels of tank-mix partners and use as directed by labeling. Follow the most restrictive labeling.

Timing and Application

Kerb SC should be applied during the fall and winter months. Optimum herbicidal activity occurs when applications are made under cool temperature conditions (55°F or less) and are followed by rainfall or overhead irrigation. Applications should always be made BEFORE SOIL FREEZE-UP.

Applications are recommended postemergence to established, actively growing or dormant alfalfa or to new plantings after the crop has reached the trifoliate leaf stage. In established stands, applications must be made after the last cutting when the weather and soil temperatures are cool. In fall-seeded crops, applications must be made after plants have reached the trifoliate leaf stage. In spring-seeded crops, application of Kerb SC must be made the following fall or early winter to suppress winter annual and perennial grasses. Do not use Kerb SC as a preplant or preemergence treatment or before the trifoliate leaf stage has developed in new plantings as injury to the stand may result. Remove or disperse trash and crop residues before treatment. Mix the recommended amount of Kerb SC in clean water and apply uniformly with a ground sprayer at 20 to 50 gallons per acre. Use a conventional herbicide sprayer equipped with flat fan nozzles at 40 to 60 psi.

Rotation Crops

Where rotation crops are to follow within one year of the Kerb SC treatment to alfalfa, follow the directions given in the General Information section of the label affixed to the product container.

Specific Use Restrictions

- Do not use more than 5 pints (2.0 pounds active ingredient) of Kerb SC per acre per year.
- Do not graze or harvest for forage or dehydration within the following intervals after application:

Alfalfa - below 3.5 pt /acre Kerb 3.3 SC (west of Mississippi River)	25 days
Alfalfa -3.5-5 pt /acre Kerb 3.3 SC (west of Mississippi River)	45 days
