

TECHNICAL INFORMATION BULLETIN FOR THE USE OF MAJESTENE® BIONEMATICIDE ON MINT

FIFRA Section 2(ee) Recommendation

This recommendation is made as permitted by Section 2(ee) of FIFRA, as amended, and has not been submitted to or approved by the U. S. Environmental Protection Agency.

FOR USE IN ALL STATES WHERE CROP AND PEST(S) EXIST AND WHERE 2(EE) RECOMMENDATIONS ARE RECOGNIZED.

MAJESTENE®

EPA Reg. No. 84059-14

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling.

Crop	Target Nematodes	Application Methods	Product Use Rate per Application	Application Instructions
MINT	Suppression of crop damage caused by plant parasitic nematodes including but not limited to; root knot, lesion, ring, sting, stubby and stunt nematodes	Pre-plant	1-2 gallons per acre for broadcast and chemigation applications prior to planting	Majestene should be used as part of an Integrated Pest Management System. Majestene can be applied following a soil fumigant. If no pre-plant fumigatant is applied, apply Majestene according to the Product Use Rate column. Use a higher product rate when higher nematode pressure is expected. There is no limit to the number of Majestene applications per season. Pre-plant; Surface spray Majestene to moist soil in 40-
				100 gallons of water per acre followed immediately by light tillage. Or surface spray Majestene in 20-40 gallons of water per acre immediately followed with sufficient overhead irrigation to wet the soil into the root zone. The amount of irrigation water should be sufficient to move the water into the root zone and will vary according to soil type.
		Post- emergence by chemigation to established stands	1 – 2 gallons per acre	Post-emergence; Apply Majestene through chemigation (overhead) by injecting Majestene into the irrigation event to allow for incorporation of the product into the soil profile at a depth sufficient to protect the root zone. Make the first application in the spring as soil temperatures warm and mint comes out of dormancy. An additional in-season application can be made to moist soils following the first cutting. Avoid applications to dry soils.

MAJESTENE® has a **pre-harvest interval (PHI)** of **0 days**.

Do not enter or allow worker entry into treated areas during the **restricted-entry interval (REI)** of **4 hours**.

Nematode management considerations - To obtain maximum results in a nematode management program, it is important to take soil samples prior to application to assess nematode populations and determination of an appropriate management strategy. Utilization of the services of a field person or crop consultant who is knowledgeable in nematode management is advised.

All applicable directions, restrictions and precautions on the EPA-registered label are to be followed.

This FIFRA Section 2(ee) recommendation contains new or additional directions for use of this product, which may not appear on the package label. Read and carefully observe the cautionary statements plus all the other information appearing on the product label.

This recommendation must be in the possession of the user at the time of pesticide application.
